

1. Prompt

“Create a detailed image of a student-made mars rover design made from accessible materials which students from the Philippines can procure. Make it a realistic design that students can follow.”

2. Prompt in ChatGPT Images

Screenshot:

3. Gemini reformulated prompt

Option 1: The "Hardware Store" Realism (Most Practical)

Prompt: A high-resolution, realistic photo of a DIY student-built Mars rover prototype sitting on a dusty classroom floor. The chassis is constructed from blue PVC pipes and grey electrical tape. It features six wheels made from plastic soda bottles with rubber bands for traction. Visible components include an Arduino board with colorful jumper wires, a small webcam "camera mast," and cardboard solar panels covered in metallic foil. Natural lighting, shallow depth of field, 8k resolution.

Option 2: The "Testing Ground" Aesthetic (Most Cinematic)

Prompt: A wide-angle, realistic shot of a student-engineered Mars rover being tested on a red-clay outdoor lot in the Philippines. The design is utilitarian, using recycled aluminum scraps, bamboo supports, and large plastic gears. A clear plastic container houses the electronics. The background shows tropical greenery under a bright sun. The image should look like a high-quality documentary photograph, focusing on the intricate textures of the scavenged materials.

Option 3: The "Blueprint" Style (Best for Following a Design)

Prompt: A clean, studio-lit "hero shot" of a school project Mars rover. The design uses a lightweight plywood base, 3D-printed yellow wheels, and a robotic arm made from popsicle sticks and small servo motors. All wiring is neatly organized with zip ties. The rover is shown from a 45-degree angle against a neutral background, highlighting the mechanical assembly and the "low-cost" engineering approach.

5. Compare and Analyze

Before going through Gemini, ChatGPT was already able to give me a full image and high resolution of what I asked: a Mars rover. However, some of the parts are unclear and even unrealistic in terms of material. As I asked Gemini to improve my prompt, it gave me three options of prompts to use. Each option focused on 3 different aspects: (1) The “Hardware Store” Realism which focuses on the practical materials students can use to make a rover. The prompt mentions specific materials to incorporate in the image; (2) The “Testing Ground” Aesthetic which I noticed focused more on the background rather than specific materials due to the Philippine setting I mentioned in my previous prompt; (3) The “Blueprint” Style similarly focused on specific materials to be used in making a rover. Rather than mentioning all the components and details of a rover, it focused more on the design of the rover and its overall look.

I like that Gemini has prompt options I can choose from depending on what I want to focus on when designing a rover. Additionally, in the last part of Gemini’s answers, it gave me tips on how to device a prompt which will improve future ChatGPT images I plan to create as it mentions the key improvements I can apply when creating a prompt from mentioning the specific materials, specifying the lighting or environment you want the image to have, and texture details to ensure that the image looks realistic and is in line with what you have imagined. AI is a powerful tool that can create many types of content. By pairing it with another AI tool, it has further improved the answer and result I was looking for.
